1. **Create a basic web application that:**

- **Displays a form on the homepage to enter a user's name**
- **Sends the form data to the server using a POST request**
- **The server should read the submitted name from the request body**
- **Finally, display a message confirming:**

2. **Create a web server that:**

- **Accepts a GET request with a dynamic user ID in the URL**
- **Also accepts additional data (name, age) using query parameters**
- **Extracts:**
  - **id from route parameters**
  - **name and age from query string**
- **Returns a JSON response containing all received data**

3. **Create an application using Express.js where:**

- **Multiple middleware functions add student name, college, and marks**
- **Data is passed using req**
- **Final route displays all values**

4. **Develop a web application that simulates a college classroom entry system using middleware:**

- **When a student accesses the /class route:**
  1. **Log that the student entered the campus**
  2. **Verify whether the student has a valid ID card**
  3. **If valid → allow entry and display a welcome message**
  4. **If not valid → deny access**
