## Embed Map – Open Google Map

- 1) Go to Google Maps.
- 2) Search for the location you want.
- 3) Click the **Share** button.
- 4) Choose the **Embed a map** tab.
- 5) Copy the <iframe> code provided.

## Standalone empty tag

A standalone empty tag is an HTML element that doesn't require a closing tag because it doesn't contain any content. These tags are typically self-closing. Some common standalone empty tags in HTML include:

- ✓ **<br /> (line break)**
- ✓ **<img /> (image)**
- ✓ **<hr /> (horizontal rule)**
- ✓ **<input /> (form input)**
- ✓ **<meta /> (metadata for the HTML document)**
- ✓ **<link /> (used to link external files, like stylesheets)**

## Clickable image (an image that acts as a hyperlink)

To create a clickable image (or an image that acts as a hyperlink) in HTML, you can use the <a> (anchor) tag and wrap it around the <img> (image) tag.

```
<a href="https://www.example.com">  
    
</a>
```

- ✓ The <a href="URL"> defines the clickable area, where URL is the link to the destination (e.g., a website or a page).
- ✓ The  specifies the image that will act as the clickable element.
- ✓ Always use the alt attribute inside the <img> tag to provide descriptive text for accessibility and better SEO.

## favicon

A **favicon** (short for “**favorite icon**”) is the **small icon that represents a website**.

You’ve definitely seen them — they appear in places like:

- The **tab bar** of your browser (next to the page title).
- On **Gmail**, you see the little **red-yellow-white-green-blue envelope “M”** in the browser tab.
- On **YouTube**, you see the red **play button triangle**.
- On WhatsApp, Green speech bubble with a white telephone icon inside.

```
<link rel="icon" type="image/png" href="favicon.png">
```

- **16×16 px** → classic browser tab icon.
- **32×32, 48×48 px** → for high-res screens.
- **180×180 px** → for iOS “Add to Home Screen”.

## Additional information in case students ask

### H1 to h6 and p tag font size

| Element | Default font size                                  |
|---------|--|
| <h1>    | 2em ( $\approx 32\text{px}$ if base is 16px)       |
| <h2>    | 1.5em ( $\approx 24\text{px}$ )                    |
| <h3>    | 1.17em ( $\approx 18.72\text{px}$ )                |
| <h4>    | 1em ( $\approx 16\text{px}$ , same as normal text) |
| <h5>    | 0.83em ( $\approx 13.28\text{px}$ )                |
| <h6>    | 0.67em ( $\approx 10.72\text{px}$ )                |
| <p>     | 1em ( $\approx 16\text{px}$ )                      |

### rem ,em and px relation understanding

- em = relative to the **parent's font size**.
- rem = relative to the **root (html) font size**.
- px = absolute pixel unit.

```
<html style="font-size:12px;">
<body>
  <p style="font-size:20px;">This text is 20px (px)</p>
  <p style="font-size:2rem;">This text is 2rem (relative to root = 24px)</p>
  <div style="font-size:18px;">
    <p style="font-size:2em;">This text is 2em (relative to parent = 36px)</p>
  </div>
</body>
</html>
```

1. **<html style="font-size:12px;">**
  - This changes the **root font size** to 12px.
  - Now 1rem = 12px.
2. **<p style="font-size:20px;">**
  - Absolute size.
  - Always **20px**.
3. **<p style="font-size:2rem;">**
  - rem is relative to **root (html)**.
  - Root = 12px.

- $2 \times 12\text{px} = 24\text{px}$ .

4. `<div style="font-size:18px;">`

- Sets parent font size to 18px.  
`<p style="font-size:2em;">`
- em is relative to **parent**, not root.
- Parent = 18px.
- $2 \times 18\text{px} = 36\text{px}$ .

- First `<p>` → **20px**
- Second `<p>` → **24px** (2rem, relative to root = 12px)
- Third `<p>` → **36px** (2em, relative to parent = 18px)
